Note: Map Interpretation – Sightings indicate a location at which Wild Pig(s) presence has been confirmed either through active surveillance (trail cameras / drone flights) or through reports made by the public. The number of sightings within a township is not a representation of the actual population of Wild Pigs but indicates the number of locations at which a confirmed sighting has occurred. An elevated number of sighting locations is therefore not directly correlated with population; areas with active surveillance and removal activities will report a greater number of sightings due to these efforts.
